

Project Design Phase
Proposed Solution Template

Date	2 October 2026
Team ID	SWTID-2026-4912
Project Name	Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Laptop requests are collected and processed manually. Requesters often do not know which CPU, RAM, storage, GPU or software their job role needs, so the IT team has to check each request against approved standard configurations and budget limits by hand. This causes delays, rework, inconsistent choices and avoidable follow-ups, and non-standard requirements are often noticed only late in the process.
2.	Idea / Solution description	An automated workflow built in Flow Designer that handles standard laptop orders end to end: 1. The employee submits their job role and requirements. 2. The requirements are validated against standard specifications (CPU, RAM, storage, GPU), required software and the budget for the role. 3. An approved standard laptop configuration is recommended automatically. 4. A procurement request is generated from the selected configuration. 5. Any non-standard requirement is detected and routed through an exception approval workflow.

3.	Novelty / Uniqueness	Replaces manual, request-by-request checking with role-based automatic recommendation and validation. Detects non-standard requirements at submission and sends only those to approvers, so standard requests are not held up. Generates the procurement request automatically, giving consistent and complete orders.
4.	Social Impact / Customer Satisfaction	Faster turnaround for employees, who receive a clear recommendation without needing technical knowledge. Less repetitive manual work for the IT procurement team, who can focus on exceptions. Consistent, budget-compliant decisions and a transparent approval process improve overall satisfaction.
5.	Business Model (Revenue Model)	The solution is built for internal use within an organisation, so it does not depend on direct sales revenue. Its value comes from reduced manual effort, fewer errors and rework, better budget control through standard configurations, and faster procurement.
6.	Scalability of the Solution	Standard configurations, job-role mappings and budget limits can be updated or extended without redesigning the workflow. The same flow can be applied to additional job roles, departments or locations, and extended to other standard IT equipment requests.
